Environment and Citizenship Mark J. Smith 2013-07-04 Citizenship and the environment are hotly debated, as climate change places more responsibility on individuals and institutions in shaping policy. Using new evidence and cases from across the globe, Environment and Citizenship explores the new vocabulary of ecological citizenship and examines how successful environmental policy-making depends on the responsible actions of citizens and civil society organizations as much as on governments and international treaties. This accessible and thought-provoking book: - provides a comprehensive and timely guide to the debates on environmental and ecological citizenship, expertly combining examples of practice with theory; - examines how environmental movements have become increasingly involved in governance processes at the local, national, regional and intergovernmental levels; - explores the increasing importance of corporations and transnational networks through examples of stakeholding processes and participatory research in environmental decision-making; - calls on researchers, policy-makers and activists to face a new challenge: how to effectively link environmental justice with social justice. Breaking new ground, Smith and Pangsapa address how environmental responsibility operates through politics, ethics, culture and the everyday experiences of ctivists, as well as how awareness of environmental and social injustice only leads to responsible actions and strategic change through civic engagement.

Rare Earth Elements Volker Zepf 2013-02-14 This thesis deals with Rare Earth Elements (REE), especially with neodymium used in permanent magnets, from a very scientific basis by providing basic research data. Despite the fact that REE are newsworthy and very important elements for a considerable bandwidth of today's technologies, accompanied by the monopolistic supply-situation and Chinese politics, there are inexplicable data discrepancies about REE which have been recognized frequently but usually have not been addressed accordingly. So this analysis started with the hypothesis that the four application areas, namely computer hard disk drives (HDD), mobile phones, wind turbines and e-mobility (automotive traction), account for about 80% of the global annual neodymium-demand. The research methodology was a laboratory analysis of the composition of used magnets for HDDs and mobile phones and a literature and official report analysis of wind turbine and automotive neodymium use. The result was amazing and the hypothesis had to be withdrawn as these four areas only account for about 20% of neodymium use. This result raises some questions concerning actual use and thus potential recycling options.
